 Multiparticle dynamics is tightly connected with the fundamental properties of the QCD vacuum. This was reflected in the Scientific Programme of the XXVIII International Symposium on Multiparticle Dynamics. Emphasis was given during the sessions to the collective phenomena at high energies, including: fluctuations and correlations, quark-gluon plasma, QCD phase transitions (fractals, intermittency, wavelets), the QCD structure of the Pomeron, and new aspects of multiplicity distributions.

"This project includes the objectives of developing a rigorous simulation package applicable to all families of rubber-tired vehicles, capable of performing energy analysis, power analysis and emissions analysis ... The vehicles of choice for this particular program were standard 40 foot city transit buses which have a high start/stop cycle, low average speeds and significant potential for energy efficiency and emissions improvements."--Introduction.

Pulmonary drug delivery has been a rapidly expanding field, moving from the traditional propellant based metered dose inhaler delivery of small asthma drugs, to a broader landscape of new devices and novel drugs for local and systemic delivery. The field has greatly expanded yet the tools for pulmonary drug delivery systems have not kept pace with the potential applications. One of the key developments has been the use of polymers to achieve better control of pulmonary drug delivery. This has the potential to expand the toolbox available for researchers in the field to deliver their new chemical entities successfully to the lung. This book reviews the use of polymers in pulmonary drug delivery, encompassing polymers from their use in devices and packaging, in addition to their use as excipients in formulations delivered to the airways. The book is arranged by application and extensively reviews the technical and patent literature. This is the first volume totally dedicated to

polymers in pulmonary drug delivery and should be the resource of choice for those in the field, especially managers in the pharma/biotech industry. Naturally, the text will be of great interest to academics and graduate students. Finally, regulatory affiliated scientists will also find this resource invaluable.

Cancer is above all a heritable disorder of somatic cells and gene expression, but environment is also involved in its origin. Hereditary kidney cancer should prove valuable to understand the mechanisms of disease and to the development of therapeutic measures. Recently, scientists have succeeded in cloning and identifying the genes responsible for the following familial kidney cancers: von Hippel-Lindau disease, papillary renal cell carcinoma, tuberous sclerosis and Wilms tumor (all autosomal dominant). This book brings together some of the most recent advances made with respect to kidney cancers: Leading investigators present recent results on VHL, MET, TSC1 and TSC2 and WT1 genes, among others, as well as on environmentally induced kidney cancers (caused by long-term hemodialysis or induced chemically) and their treatments (surgery and gene therapy), providing an excellent survey of this field. This publication will be of interest to both researchers and clinicians concerned with cancer of the kidney.

This three-volume set represents the first comprehensive coverage of the rapidly expanding field of Lewis base catalysis that has attracted enormous attention in recent years. Lewis base catalysis is a conceptually novel paradigm that encompasses an extremely wide variety of preparatively useful transformations and is particularly effective for enantioselectively constructing new stereogenic centers. As electron-pair donors, Lewis bases can influence the rate and stereochemical course of myriad synthetic organic reactions. The book presents the conceptual/mechanistic principles that underlie Lewis base catalysis, and then builds upon that foundation with a thorough presentation of many different reaction types. And last but not least, the editors, Prof. Edwin Vedejs and Prof. Scott E. Denmark, are without doubt the leaders in this emerging field and have compiled high quality contributions from an impressive collection of international experts.

The glomerulopathies are the diseases affecting the filtering units of the kidneys. In *Glomerulopathies: Cell Biology and Immunology*, the author details how recent advances in cell biology and immunology are able to advance our understanding such that we should be able to ameliorate or even arrest the course of these diseases. In addition to discussing the fundamental

concepts, the book covers recent advances pertinent to the pharmacological and clinical management of glomerulonephritides and diabetic nephropathy. The book uses a blend of basic science and clinical and experimental findings in a way that is suitable both for trainees in medical science and professional nephrologists.
