Symplectic and contact geometry naturally emerged from the mathematical description of classical physics. The discovery of new rigidity phenomena and properties satisfied by these geometric structures launched a new research field worldwide. The intense activity of many European research groups in this field is reflected by the ESF Research Networking Programme "Contact And Symplectic Topology" (CAST). The lectures of the Summer School in Nantes (June 2011) and of the CAST Summer School in Budapest (July 2012) provide a nice panorama of many aspects of the present status of contact and symplectic topology. The notes of the minicourses offer a gentle introduction to topics which have developed in an amazing speed in the recent past. These topics include 3-dimensional and higher dimensional contact topology, Fukaya categories, asymptotically holomorphic methods in contact topology, bordered Floer homology, embedded contact homology, and flexibility results for Stein manifolds.

Advances in the Research of Aquatic Environment Springer Science & Business Media

In the last, rootless decade families, neighborhoods, and communities have disintegrated in the face of gripping social, economic, and technological changes. This process has had mixed results. On the positive side, it has produced a mobile, volatile, and dynamic society in the United States that is perhaps more open, just, and creative than ever before. On the negative side, it has dissolved the glue that bound our society together and has destroyed many of the myths, symbols, values, and beliefs that provided social direction and purpose. In *A History of the Polish Americans*, John J.

Bukowczyk provides a thorough account of the Polish experience in America and how some cultural bonds loosened, as well as the ways in which others persisted.
